angcdf *Empirical-Likelihood Based Inference for the Angular Measure*

---

## Description

This function computes empirical-likelihood based estimators for the angular distribution function of a bivariate extreme value distribution.

## Usage

```
angcdf(Y, tau = 0.95, method = "euclidean", raw = TRUE)
```

## Arguments

Y	data frame with two columns from which the estimate is to be computed.
tau	value used to threshold the data; by default it is set as the 0.95 quantile of the pseudo-radius $\tau = 0.95$ .
method	a character string setting the method to be used. By default <code>method = "euclidean"</code> , the other option being <code>method = "empirical"</code> . See details.
raw	logical; if TRUE, Y will be converted to unit Fréchet scale. If FALSE, Y will be understood as already in unit Fréchet scale.

## Details

`method = "euclidean"` implements the maximum Euclidean likelihood spectral distribution function as introduced by de Carvalho et al (2013). `method = "empirical"` implements the maximum Empirical likelihood spectral distribution function as introduced by Einmahl and Segers (2009).

## Value

H	angular distribution function.
w	pseudo-angles.
Y	data.

The `plot` method depicts the empirical likelihood-based angular distribution function.

## Author(s)

Miguel de Carvalho

## References

- de Carvalho, M., Oumow, B., Segers, J. and Warchol, M. (2013) A Euclidean likelihood estimator for bivariate tail dependence. *Communications in Statistics—Theory and Methods*, 42, 1176–1192.
- Einmahl, J. H. J., and Segers, J. (2009) Maximum empirical likelihood estimation of the spectral measure of an extreme-value distribution. *The Annals of Statistics*, 37, 2953–2989.

## Examples

```
## de Carvalho et al (2013, Fig. 7)
data(beatenberg)
attach(beatenberg)
fit <- angcdf(beatenberg, tau = 0.98, raw = FALSE)
plot(fit)
rug(fit$w)
```

---

angdensity

*Empirical-Likelihood Based Inference for the Angular Density*

---

## Description

This function computes empirical-likelihood based estimators for the angular distribution function of a bivariate extreme value distribution.

## Usage

```
angdensity(Y, tau = 0.95, nu, grid = seq(0.01, 0.99, length = 2^8),
  method = "euclidean", raw = TRUE)
```

## Arguments

Y	data frame with two columns from which the estimate is to be computed.
tau	value used to threshold the data; by default it is set as the 0.95 quantile of the pseudo-radius.
nu	concentration parameter of beta distribution which controls the amount of smoothing.
grid	grid with coordinates of the points where the angular density is estimated; by default <code>grid = seq(0.01, 0.99, length = 2^8)</code> .
method	a character string setting the method to be used. By default <code>method = "euclidean"</code> , the other option being <code>method = "empirical"</code> . See details.
raw	logical; if TRUE, Y will be converted to unit Fréchet scale. If FALSE, Y will be understood as already in unit Fréchet scale.

## Details

The smooth angular density was introduced in by de Carvalho et al (2013). `method = "euclidean"` implements the version of the method based on Euclidean likelihood weights, whereas `method = "empirical"` uses Empirical likelihood weights.

**Value**

h                    the estimate angular density values.  
 grid                grid with coordinates of the points where the angular density is estimated.  
 w                    pseudo-angles.  
 nu                   concentration parameter of the Beta-kernel.  
 Y                    raw data.

The plot method depicts the smooth angular density.

de Carvalho, M., Oumow, B., Segers, J. and Warchol, M. (2013) A Euclidean likelihood estimator for bivariate tail dependence. *Communications in Statistics—Theory and Methods*, 42, 1176–1192.

**Examples**

```
## de Carvalho et al (2013, Fig. 7)
data(beatenberg)
attach(beatenberg)
fit <- angdensity(beatenberg, tau = 0.98, nu = 163, raw = FALSE)
plot(fit)
rug(fit$w)
```

---

angscdf

*Smooth Empirical-Likelihood Based Inference for the Angular Measure*

---

**Description**

This function computes smooth empirical-likelihood based estimators for the angular distribution function of a bivariate extreme value distribution.

**Usage**

```
angscdf(Y, tau = 0.95, nu, grid = seq(0.01, 0.99, length = 2^8),
  method = "euclidean", raw = TRUE)
```

**Arguments**

Y	data frame with two columns from which the estimate is to be computed.
tau	value used to threshold the data; by default it is set as the 0.95 quantile of the pseudo-radius $\tau = 0.95$ .
nu	concentration parameter of beta distribution which controls the amount of smoothing.
grid	grid with coordinates of the points where the angular measure is estimated; by default <code>grid = seq(0.01, 0.99, length = 2^8)</code> .
method	a character string setting the method to be used. By default <code>method = "euclidean"</code> , the other option being <code>method = "empirical"</code> . See details.
raw	logical; if TRUE, Y will be converted to unit Fréchet scale. If FALSE, Y will be understood as already in unit Fréchet scale.

**Details**

`method = "euclidean"` implements the maximum Euclidean likelihood spectral distribution function as introduced by de Carvalho et al (2013). `method = "empirical"` implements the maximum Empirical likelihood spectral distribution function as introduced by Einmahl and Segers (2009).

**Value**

H	the estimated angular distribution function values.
grid	grid with coordinates of the points where the angular measure is estimated.
w	pseudo-angles.
nu	concentration parameter of the Beta-kernel.
Y	raw data.

The `plot` method depicts the empirical likelihood-based angular distribution function.

fit <- angscdf(beatenberg, tau = 0.98, nu = 163, raw = FALSE)
plot(fit)
rug(fit$w)
```

---

beatenberg	<i>Beatenberg</i>
------------	-------------------

---

**Description**

Preprocessed pairs of temperatures in unit Fréchet scale from Beatenberg forest, registered under forest cover and in the open field. Preprocessing is conducted as described in Ferrez et al (2011).

**Usage**

```
beatenberg
```

**Format**

The beatenberg data frame has 2839 rows and 2 columns.

**References**

Ferrez, J., A. C. Davison, and Rebetez., M. (2011) Extreme temperature analysis under forest cover compared to an open field. *Agricultural and Forest Meteorology*, 151, 992–1001.

---

cdensity	<i>Kernel Smoothed Joint Scedasis Density</i>
----------	---

---

**Description**

This function computes a kernel joint scedasis density estimate.

**Usage**

```
cdensity(XY, tau = 0.95, raw = TRUE, structure = "min", ...)
```

**Arguments**

XY	data frame from which the estimate is to be computed; first column corresponds to time, the second and third columns correspond to the variables of interest X and Y respectively.
tau	value used to threshold the data $Z = \min(X, Y)$ ; by default <code>threshold = quantile(Z, tau)</code> .
raw	logical; if TRUE, X and Y will be converted to unit Fréchet scale. If FALSE, X and Y will be understood as already in unit Fréchet scale. If a single variable is provided raw is automatically set to TRUE.
structure	the structure scedasis option: "min", "max", "sum". The default will compute the minimum.
...	further arguments for density methods.

**Details**

This function learns about the joint scedasis function using kernel methods as discussed in Palacios and de Carvalho (2020). In the particular case where  $XY$  contains no third column, the function learns about the scedasis function of Einmahl et al (2016).

**Value**

`c`                    scedasis density estimator.  
`k`                    number of exceedances above the threshold.  
`w`                    standardized indices of exceedances.  
`XY`                   raw data.

The `plot` method depicts the smooth scedasis density.

**Author(s)**

Miguel de Carvalho and Vianey Palacios

**References**

Einmahl, J. H., Haan, L., and Zhou, C. (2016) Statistics of heteroscedastic extremes. *Journal of the Royal Statistical Society: Ser. B*, 78(1), 31–51.

Palacios, V. and de Carvalho, M. (2020) Bayesian semiparametric modeling of jointly heteroscedastic extremes. *Preprint*.

**Examples**

```
data(lse)
attach(lse)
XY <- data.frame(DATE[-1], -diff(log(ROYAL.DUTCH.SHELL.B)))
T <- dim(XY)[1]
k <- floor((0.4258597) * T / (log(T)))
fit <- cdensity(XY, kernel = "biweight", bw = 0.1 / sqrt(7))
plot(fit)
plot(fit, original = FALSE)

## Example from Palacios and de Carvalho (2020, submitted)
library(evd)
T <- 5000
time <- seq(1/T, 1, by = 1/T)
set.seed(1263)
aux <- matrix(0,T,2)
for(i in 1:T) {
  aux[i,] <- rbvevd(1,dep=sin(time[i]*pi),model="log",
  mar1 = c(1, 1, 1), mar2 = c(1,1,1))}
XY <- cbind(time,aux)
fit <- cdensity(XY, kernel = "biweight", bw = 0.1)
plot(fit)
```

---

`cdf`*Empirical Scedasis Distribution Function*

---

**Description**

This function computes the empirical scedasis distribution function.

**Usage**

```
cdf(Y, threshold = quantile(Y[, 2], 0.95))
```

**Arguments**

<code>Y</code>	data frame from which the estimate is to be computed; first column corresponds to time and the second to the variable of interest.
<code>threshold</code>	value used to threshold the data <code>y</code> ; by default <code>threshold = quantile(Y[, 2], 0.95)</code> .

**Details**

The empirical scedasis distribution function was introduced by Einmahl et al (2016).

**Value**

<code>C</code>	empirical scedasis distribution function.
<code>w</code>	standardized indices of exceedances.
<code>k</code>	number of exceedances above a threshold.
<code>Y</code>	raw data.

The `plot` method depicts the empirical cumulative scedasis function, and the reference line for the case of constant frequency of extremes over time (if `uniform = TRUE`).

**Author(s)**

Miguel de Carvalho

**References**

Einmahl, J. H., Haan, L., and Zhou, C. (2016) Statistics of heteroscedastic extremes. *Journal of the Royal Statistical Society: Ser. B*, 78(1), 31–51.

**Examples**

```
data(sp500)
attach(sp500)
Y <- data.frame(date[-1], -diff(log(close)))
fit <- cdf(Y)
plot(fit)
plot(fit, original = FALSE)
```

---

`cmodes`*Mode Mass Function*

---

**Description**

This function computes the mode mass function.

**Usage**

```
cmodes(Y, thresholds = apply(Y[, -1], 2, quantile, probs =  
                                0.95), nu = 100, ...)
```

**Arguments**

<code>Y</code>	data frame from which the estimate is to be computed; first column corresponds to time and the second to the variable of interest.
<code>thresholds</code>	values used to threshold the data <code>y</code> ; by default <code>threshold = quantile(y, 0.95)</code> .
<code>nu</code>	concentration parameter of beta kernel used to smooth mode mass function.
<code>...</code>	further arguments for density methods.

**Details**

The scedasis functions on which the mode mass function is based are computed using the default "nrd0" option for bandwidth.

**Value**

<code>c</code>	scedasis density estimators.
<code>k</code>	number of exceedances above the threshold.
<code>w</code>	standardized indices of exceedances.
<code>Y</code>	raw data.

The `plot` method depicts the smooth mode mass function along with the smooth scedasis densities.

**Author(s)**

Miguel de Carvalho

**References**

Rubio, R., de Carvalho, M., and Huser, R. (2018) Similarity-Based Clustering of Extreme Losses from the London Stock Exchange. Submitted.

**Examples**

```

data(lse)
attach(lse)
nlr <- -apply(log(lse[, -1]), 2, diff)
Y <- data.frame(DATE[-1], nlr)
T <- dim(Y)[1]
k <- floor((0.4258597) * T / (log(T)))
fit <- cmodes(Y, thresholds = as.numeric(apply(nlr, 2, sort)[T - k, ]),
             kernel = "biweight", bw = 0.1 / sqrt(7), nu = 100)
plot(fit)

```

cPTdensity

*Nonparametric Bayesian Estimation of Structure Scedasis Density using Mixtures of Polya Trees*

**Description**

This function computes a Bayesian structure scedasis density estimate generating a posterior sample of a finite Mixture of Polya trees.

**Usage**

```

cPTdensity(XY, tau = 0.95, raw = TRUE, structure = "min", prior, mcmc, state,
           status, data = sys.frame(sys.parent()), na.action = na.fail)

```

**Arguments**

XY	data frame from which the estimate is to be computed; first column corresponds to time, the second and third columns correspond to the variables of interest X and Y respectively.
tau	value used to threshold the data $z = \min(X, Y)$ ; by default threshold = quantile(z, tau).
raw	logical; if TRUE, X and Y will be converted to unit Fréchet scale. If FALSE, X and Y will be understood as already in unit Fréchet scale. If a single variable is provided raw is automatically set to TRUE.
structure	the structure scedasis option: "min", "max", "sum". The default will compute the minimum.
prior	a list giving the prior information. The list includes the following parameter: a0 and b0 giving the hyperparameters for prior distribution of the precision parameter of the Poly tree prior, alpha giving the value of the precision parameter (it must be specified if alpha is missing, see details below), optionally M giving the finite level to be considered (if M is specified, a partially specified mixture of Polya trees model is fitted), tau1 and tau2 giving the hyperparameters of the inverted gamma prior distribution for the centering Beta scale parameter, m0 and S0 giving the hyperparameters of the inverted gamma prior distribution for the centering Beta scale parameter, and a1, b1 giving the value of the shape and scale parameter of the centering distribution.

mcmc	a list giving the MCMC parameters. The list must include the following integers: nburn giving the number of burn-in scans, nskip giving the thinning interval, nsave giving the total number of scans to be saved, ndisplay giving the number of saved scans to be displayed on screen (the function reports on the screen when every ndisplay iterations have been carried out), tune1, tune2, and tune3 giving the positive Metropolis tuning parameter for the baseline shape, scale, and precision parameter, respectively (the default value is 1.1)
state	a list giving the current value of the parameters. This list is used if the current analysis is the continuation of a previous analysis.
status	a logical variable indicating whether this run is new (TRUE) or the continuation of a previous analysis (FALSE). In the latter case the current value of the parameters must be specified in the object state.
data	data frame.
na.action	a function that indicates what should happen when the data contain NAs. The default action (na.fail) causes PTdensity to print an error message and terminate if there are any incomplete observations.

## Details

This function learns about the structure scedasis function using a Mixture of Polya Trees (MPT) prior as proposed in Palacios and de Carvalho (2020). In the particular case where XY contains no third column, the function learns about the scedasis function of Einmahl et al (2016) using an MPT prior. The details are as follows. Let

$$Z_i = \min(X_i, Y_i)$$

. The model is given by:

$$\begin{aligned} Z_1, \dots, Z_n | G &\sim G \\ G | \alpha, al, be &\sim PT(\Pi^{al, be}, A) \end{aligned}$$

where, the the PT is centered around a  $Beta(al, be)$  distribution, by taking each  $m$  level of the partition  $\Pi^{al, be}$  to coincide with the  $k/2^m, k = 0, \dots, 2^m$  quantile of the  $Beta(al, be)$  distribution. The family  $A = \{\alpha_e : e \in E^*\}$ , where  $E^* = \bigcup_{m=0}^m E^m$  and  $E^m$  is the  $m$ -fold product of  $E = \{0, 1\}$ , was specified as  $\alpha_{e_1 \dots e_m} = \alpha m^2$ .

In the univariate case, the following proper priors can be assigned:

$$\begin{aligned} al | m_0, S_0 &\sim LNormal(m_0, S_0) \\ be | \tau_1, \tau_2 &\sim LNormal(\tau_1, \tau_2) \end{aligned}$$

To complete the model specification, independent hyperpriors are assumed,

$$\alpha | a_0, b_0 \sim \Gamma(a_0, b_0)$$

The precision parameter,  $\alpha$ , of the PT prior can be considered as random, having a gamma distribution,  $\Gamma(a_0, b_0)$ , or fixed at some particular value. To let  $\alpha$  to be fixed at a particular value, set  $a_0$  to NULL in the prior specification.

In the computational implementation of the model, Metropolis–Hastings steps are used to sample the posterior distribution of the baseline and precision parameters.

**Value**

c                    Structure scedasis density estimator.  
 k                    number of exceedances above the threshold.  
 w                    standardized indices of exceedances.  
 Y                    raw data.  
 a1                    giving the value of the baseline shape parameter.  
 be                    giving the value of the baseline scale parameter.  
 alpha                giving the value of the precision parameter.  
 The plot method depicts the estimated structure scedasis density.

---

kgvar	<i>K-Geometric Means Algorithm for Value-at-Risk</i>
-------	--

---

**Description**

This function performs k-geometric means for time-varying value-at-risk.

**Usage**

```
kgvar(y, centers, iter.max = 10, conf.level = 0.95)
```

**Arguments**

y	data frame from which the estimate is to be computed; first column corresponds to time and the second to the remainder of interest.
centers	the number of clusters or a set of initial (distinct) cluster centres. If a number, a random set of (distinct) rows in y is chosen as the initial centers.
iter.max	the maximum number of iterations allowed. The default is 10.
conf.level	the confidence level. The default is 0.95.

**Details**

The intermediate sequence  $\kappa_T$  is chosen proportional to  $T/\log T$ .

**Value**

kgvar returns an object of class "kgvar" which has a fitted method. It is a list with at least the following components:

var.new	cluster center value-at-risk function.
clusters	cluster allocation.
Y	raw data.
n.clust	number of clusters.
scale.param	the scale parameters in the Pareto-like tail specification.
conf.level	the confidence level.
hill	hill estimator of extreme value index.

The plot method depicts the k-geometric means algorithm for time-varying value-at-risk. If c.c is TRUE, the method displays the cluster means.

khetmeans

*K-Means Clustering for Heteroscedastic Extremes*

---

## Description

This function performs k-means clustering for heteroscedastic extremes.

## Usage

```
khetmeans(y, centers, iter.max = 10, alpha = 0.5)
```

## Arguments

y	data frame from which the estimate is to be computed; first column corresponds to time and the second to the remainder of interest.
centers	the number of clusters or a set of initial (distinct) cluster centres. If a number, a random set of (distinct) rows in y is chosen as the initial centers.
iter.max	the maximum number of iterations allowed. The default is 10.
alpha	the tuning parameter. The default is 0.5.

## Details

The intermediate sequence  $\kappa_T$  is chosen proportional to  $T/\log T$ .

## Value

khetmeans returns an object of class "khetmeans" which has a fitted method. It is a list with at least the following components:

mus.new	cluster center scedasis density.
mugamma.new	cluster center extreme value index.

clusters	cluster allocation.
Y	raw data.
n.clust	number of clusters.

The plot method depicts the k-means clustering for heteroscedastic extremes. If `c.c` is TRUE, the method displays the cluster means.

lse

*Selected Stocks from the London Stock Exchange*

---

### Description

Prices at close from 26 selected stocks from the London stock exchange from 1989 till 2016.

### Usage

lse

### Format

The lse data frame has 6894 rows and 27 columns.

### References

Rubio, R., de Carvalho, M., and Huser (2018) Similarity-based clustering of extreme losses from the London stock exchange.

---

plotFrechet

*Unit Fréchet Scatterplot in Log-log Scale*

---

### Description

This function depicts a scatterplot of bivariate data transformed to unit Fréchet scale.

### Usage

plotFrechet(Y, tau = 0.95, raw = TRUE, ...)

**Arguments**

Y	list with data from which the estimates are to be computed.
tau	value used to threshold the data y; by default <code>treshold = quantile(y, 0.95)</code> .
raw	logical; if TRUE, Y will be converted to unit Fréchet scale. If FALSE, Y will be understood as already in unit Fréchet scale.
...	other arguments to be passed to <code>plot</code> .

**Details**

The solid line corresponds to the boundary threshold in the log-log scale, with both axes being logarithmic.

**Author(s)**

Miguel de Carvalho
